CC The peptide can be used in the method of the invention. The invention of the production of transgenic plants that express a protein cC able to produce hydrogen peroxide. The production method comprises cC transforming a plant cell with Agrobacterium rhizogenes containing a cC vector that carries a gene encoding the protein to be expressed in the cC transgenic plant, selection is made for the expression of the gene in a cC colorimetric test using peroxidase. Plants are transformed to produce a cC protein of interest, specifically oxalate oxidase (OO):

CC (i) to impart resistance to pathogens (OO degrades oxalic acid, a cC phytotoxin produced by many phytopathogens); or cC (ii) as a selection system for plants transformed with a second gene, cencoding another protein of interest, introduced in the same vector as cC the gene encoding the first protein of interest. Particularly the second cC protein confers resistance to pathogens (fungi, bacteria, insects, insects, and is specifically endo-chitinase. The method uses a cC simple and rapid method, based on a colorimetric test, to select for transformation, particularly using as test sample roots induced by CC Agrobacterium rhizogenes. It is not necessary that the cells being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The polynucleotides may further comprises a sequence encoding a C-terminal microsomal retention signal sequence. The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Localisation colorimetric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      08-OCT-1999;

                                      The present sequence is that of an endoplasmic reticulum (ER)

CC retention peptide obtained from pCMV/myc/ER. An aspect of the

CC invention is a phage display library which expresses a heavy chain

CC capable of inhibiting the activity of a secreted protein. Sequences

CC encoding heavy chains capable of binding the desired secreted

CC protein and inhibiting its activity are inserted into a eukaryotic

CC expression vector such that thay are operably linked to sequences

CC coding for signal peptides which direct the resulting fusion

CC proteins to the ER. Preferably, the heavy chains are also linked to

CC a sequence which encodes a polypeptide directing the retention of

CC is synthesised on the ribosomes on the surface of the ER and passed

CC through a pore to the ER awaiting further modification for

CC secretion. The heavy chain binds its target in the ER, causing the

CC identify the target protein as misfolded and escort the target

CC protein/heavy chain complex out of the ER and into the cytoplasm by

CC described the retrograde pathway, and the misfolded complex is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

The delivery method of the invention causes a drug to become almost immediately localised at its site of action in an inactive form where it accumulates. Once released by antibody degradation, the drug is at an effective concentration only at the target site, with very little free drug being available in the rest of the body. The system of the invention therefore reduces the side effects caused by therapeutic agents, and also provides economic benefits as a smaller amount can be administered to the patient. Sequences AAB22835- AAB22837 and AAB22839-B22857 represent subcellular localisation sequences which can incorporated into a drug-specific antibody used in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-terminus via a protesse cleavage site. On administration of the drug, the antibody binds the drug, localising it at the target cells but maintaining it in an inactive state. As the antibody is degraded (the timescale for which is dependent upon the N-terminal or stabilon amino acids), the drug is released at its site of action where it can exert its effects. The antibody encoded by the expression construct (and therefore the therapeutic agent) can be targetted to particular subcellular locations (e.g., the nucleus) by including the appropriate cellular localisation signals. The novel method may be used to deliver therapeutic agents to patients with a variety of conditions such as the properties and contents with a variety of conditions such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding an antibody (particularly a single chain antibody) to the drug to be delivered. The antibody contains a modulator of intracellular half-life; this can either be a stabilising or destabilising residue located in the N-terminus after the initial methionine, or a peptide ("stabilon") containing a stabilising residue linked to the antibody
                                                                                                                                                                                                                                                                                                                                                                          WO200037610-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Endoplasmic reticulum retention signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              03-OCT-2000

The antigen is especially a hepatitis B surface antigen (HBsAg). The expression vector is used to transform bacterial and plant cells to elicit the production of anti-hepatitis B antibodies and are useful as vaccines. The present sequence represents
                                                                                     Claim 9;
                                                                                                              elicit immune
                                                                                                                          New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic composition
                                                                                                                                                                                                                                                                                                                                                                      Synthetic
                                                                                                                                                                                                                                                                                                                                                                                           Heat-labile toxin; LT-A; LT-B; mutant; transgenic plant; vaccine; oral; adjuvant; anti-bacterial; microsomal retention signal sequence.

```

Novel polynucleotides encode a mutant Escherichia coli heat-labile (LT-A) polypeptide or a mutant Vibrio cholerae cholera toxin (CT) subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at 10 of the codons is altered to a plant preferred codon. The polynucle further comprises a nucleic acid sequence encoding LT B subunit ()

The specification describes DNA constructs that encode a fusion protein that comprises a subunit of an enterotoxin and a signal peptide. When transgenic plants containing the constructs are fed to mammals or birds, they induce immunity against the enterotoxin, specifically that of cholera. Alternatively, the plants are consumed to provide an adjuvant effect, in conjunction with administration of a live, dead or attenuated dose of pathogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cholera

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a carboxy terminal endoplasmic reticulum retention signal. The nucleotide sequence encoding this signal may be incorporated into a primer used to amplify DNA encoding the kappa light chain constant region of human antibodies. The protein encoded by the PCR product will contain a signal for the endoplasmic reticulum. A heavy chain and a light chain may be joined through a linke to form a single-chain antibody. A stabilising fusion peptide, referred to as a stabilon, may be linked to the N-terminus of the single-chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antibody to increase stability of the antibody against proteolysis in vivo. Degradation of the antibody may be modulated by linking the stabilon to the antibody through a protease-sensitive linker region. The stabilon is removed upon induction of expression of a specific restriction protease by means of an inducible promoter, and this renders the antibody susceptible to proteolysis by the N-end rule pathway. This method for regulating protein stability allows removal of the antibody after it has bound to its target antigen. Stabilised recombinant proteins may be used in gene therapy for the treatment of disorders such as
                                                                                                                                                                                                                                                                                                                                              Controlled release delivery system, drug targetting, drug-specific antibody; intracellular half-life; gene therapy; diabetes; autoimmune disease; inflammatory disease; infectious cancer; side effect; subcellular localisation sequence.

                                                                                                                                                                                                                                                                                                                                    to treat, prevent or diagnose tumors (e.g. as tumor vaccines), autoimmune diseases and inflammation (e.g. transplant rejection and arthritis), blood disorders (e.g. of the coagulation and/or circulatory systems, such as anemia, leucopenia, thrombocytopenia and hypertension), nervous system disorders and/or infections (by viruses or bacteria, or malaria), including, when (I) include a fusogenic peptide, use for gene transfer.

(I) are produced simply and in predominantly homogeneous form, in a wide variety of hosts, either in secreted or membrane-bound forms. This sequence represents a VH-VL domain linker peptide which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               multiple antigens and comprises two variable domains of heavy immunoglobulin chains (VH), having specificities A and B and two variable domains of light chains (VL), also with specificities A and B. The domains are provided as two VH-VL constructs which are attached via a peptide (P). Any VH and VL may be replaced by their functional fragments. The products of the invention have anticancer, antiviral, antibacterial, antimalarial and antiinflammatory activity. (1) are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polyspecific binding agents containing variable heavy and light constructs connected via peptide linker, used for treatment, prevention or diagnosis of e.g. cancer -

                                                                                                                                                                                                  멂
                                                                                                                                                                                                                                á
                                                                                                                                                                                                                                                                                                                                                                                              Intracellular binding to a desired target by an intracellularly cappressed antibody (i.e. an intrabody) can be used to knock out multiple locuses of immunomodulatory receptor molecules (IRMs), so that the expression of multiple major histocompatibility (MHC) molecules is blocked. This selective targeting of IRMs, their pathways or components, can be used to selectively regulate the immune system by controlling expression of these molecules and preventing an undesired immune response in a cell. Any component of the MHC pathway or the MHC assembly line or antigen presentation can be targeted. Intrabodies can be used to knock out the immune response in a particular tissue or portion of the body to prepare it for cell or tissue transplantation. Alternatively, an organ for transplantation can be perfused with the intrabody ex vivo. The intrabodies can comprise whole antibodies, heavy chains, Fab' fragments, single-chain antibodies and diabodies. The intrabodies also comprise an intracellular localisation signal to facilitate interception of expressed proteins. For example, if the target was a cell surface receptor, the antibody would comprise a leader retention signal. This peptide is an endoplasmic reticulum (ER) or Goldi apparatus
                                                                                                                                                                                                                                                                 Query Match

The antibody is esp. a single chain antibody in which the heavy and light chain variable regions are joined via a hydrophilic linker peptide. The 3' Ckappa primer AQ56576 can be used with a forward Vkappa primer to amplify an antibody light chain sequence; the primer contains the C-terminal endoplasmic reticulum retention signal SEXDEL (AAR40284).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Intracellular binding of antigens -
with vector system, for e.g. tumour
                                             A transgenic plant comprising or expressing a DNA sequence encoding an immunogenic agent can be be used as an orral vaccine for animals. The vaccine is administered by the oral consumption of the plant and provides the first known functional method for immunising animals using transgenic plants, where the plants express bacterial antigens that act as both immunogens and adjuvants. The method provides an inexpensive production and delivery system for such antigens to

The immunogenic agent preferably comprises the LT-B or CT-B (cholera toxin B subunit) optionally LT-A or CT-A.
                                                                                                                     The endoplasmic reticulum retention signal sequence was used in the method of the invention to generate lymphocytes that are resistant to HIV infection due to the lack of an expressed co-receptor. The products and methods can be used for inhibiting phenotypic expression of a chemokine receptor in a cell. In particular they can provide lymphocytes that are resistant to HIV infection due to the lack of an expressed co-receptor. They can be used in the therapy or prevention of HIV infection and in the prevention or treatment of opportunistic infections in AIDS or ARC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HIV resistant lymphocyte; chemokine receptor; HIV; intracellular retention signal sequence.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBCELLULAR LOCATION: Nuclear.

DEVELOPMENTAL STAGE: EXPRESSED PRIOR TO THE FORMATION OF DISTINCT MOTOR AXON PATHWAYS AND BEFORE THE SEGREGATION OF MOTOR NEURONS INTO COLUMNS. EXPRESSED THROUGHOUT THE MEDIAM MOTOR COLUMN AND THE MEDIAL SUBDIVISION OF THE LATERAL MOTOR COLUMN (LMCM).

SIMILARITY: Contains 1 homeobox domain.

"PSII-S gene expression, photosynthetic activity and abundance of
plastid thioredoxin-related and lipid-associated proteins during
chilling stress in Solanum species differing in freezing resistance.",
physiol. Plantarum 113:72-78(2001).
-!- FUNCTION: Seems to be involved in nonphotochemical quenching, a
process maintains the balance between dissipation and utilization
of light energy to minimize generation of oxidizing molecules,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE
